

ABSTRACT OF THE DISCLOSURE

A surgical instrument has an insertion section,  
an operation section disposed in a proximal end of  
the insertion section, and a treatment section disposed  
5 in a distal end of the insertion section. First and  
second driving rods are disposed in the insertion  
section. The operation section is opened/closed and  
rotated to transmit an opening/closing force to the  
first driving rod, and a rotating force to the second  
10 driving rod. The treatment section comprises a pair of  
jaws. The treatment section is connected to the distal  
end portions of the first and second driving rods  
disposed in the insertion section to rotate and  
open/close the pair of jaws with respect to the  
15 insertion section.
